

Table 1: Measure of apparent effects by SimsLIMS segregated by apparent effect, apparent effect significant ($p < 0.05$), frequency of apparent effect in same direction among studies significant ($P < 0.05$) and average apparent effect by averaging of all experiments. Values are represented as mean percent + SD.

Effects	N/group	Apparent effect	Apparent effect with $p < 0.05$	Apparent effect with $p < 0.05$ showing same trend	Average magnitude of apparent effect
Random effect	20	47.6 \pm 0.565	1.09 \pm 8.7	23.7 \pm 4.4	0.03 \pm 0.61
Female Gender effect	20	74.9 \pm 3.47	12.94 \pm 0.53	99.7 \pm 1.39	3.1 \pm 0.2
